WIND FARM

energysoft

TURN YOUR WIND FARMS SMART

Cloud application for monitoring energy production and consumption sites, for professionals and businesses experts

News

MONITOR

Visualise the performance of all your assets at a glance, and be alerted in case of malfunction or production drop

ANALYSE

Use advanced analytics tools to track performance and receive customised reports

MAINTAIN

Reduce the downtime of your wind farms thanks to the integrated maintenance module and the mobile application for service technicians

ADMINISTRATE

**Manage users and customise dashboards.
Plan commissioning in autonomy according to your own timeline**

S4E
soft4energy

User-tailored views

Energysoft software is suitable for any type of wind farms

OPERATORS

Access your portfolio monitoring, manage your interventions and create your own maintenance reports

INVESTORS

Track the actual performance of your entire portfolio

ASSET MANAGERS

Manage your assets with customised KPIs, tables and reports

With Energysoft, bring customised monitoring to your wind farms

A cloud solution for remote performance analysis

Energysoft helps you monitor all your wind farms thanks to its custom dashboards and its ability to send you alarms on malfunctions.

The software offers advanced analysis, such as production modeling

APIs for an open solution

Energysoft **can connect to manufacturers' APIs to retrieve operating data from your portfolio, but also to connect to ENEDIS to take meter readings.**
In the other direction, our APIs based on the ODATA standard allow your reporting tools and more generally your information system to read the data aggregated and standardised by **Energysoft.**

A multi-site, multi-manufacturer solution

Energysoft interconnects with your on-site SCADA (OPC). The information collected is processed, analysed and aggregated to be available and displayed in several forms:

- Custom dashboards consisting of widgets (charts, tables ...) that you assemble according to your needs
- Custom alerts sent by email, SMS or mobile notifications
- Custom reports generated and sent automatically

Remote maintenance management

The integrated maintenance tool allows the tracking of information from the detection of a fault to the closure of the incident. **Using the mobile application, service technicians can generate a report directly live from from the production site.**
